Quarto

Quarto enables you to weave together content and executable code into a finished document. To learn more about Quarto see <https://quarto.org>.

Running Code

HOW to create repo on github

““{On that blue Quick setup box, click the link “uploading an existing file” (it’s right after “creating a new file”).}

Drag in your three files:

app.py (you can rename your piece_of_advice_app.py to app.py before uploading)

requirements.txt (contents: streamlit>=1.36)

advice_data.json

Add a commit message → Commit changes.

Or make the button appear

Click creating a new file → name it README.md → put any text → Commit.

Now you’ll see the file list. At the top right (above the list, next to the green Code button) there’s a dropdown Add file → Upload files. Use that to upload the 3 files.

Once the files are in the repo, you can deploy on Streamlit Cloud: New app → pick the repo → set App file to app.py → Deploy.

DEPLOY in streamlit

```{Deploy to Streamlit Community Cloud (easiest)}

Go to [streamlit.io/cloud](https://streamlit.io/cloud) and sign in with GitHub.

Click New app.

Pick your repo: krisauw / a\_piece\_of\_advice, branch main.

App file: app.py.

Leave the rest as defaults (it will install from requirements.txt).

Click Deploy.

You'll get a public URL in a minute. Any push to GitHub will auto-redeploy (if you add libraries).

Run locally (for testing)

# from your project folder

python -m venv .venv

. .venv/Scripts/activate # Windows

pip install -r requirements.txt

streamlit run app.py

Common gotchas

Keep advice\_data.json in the same folder as app.py (you already did).

If the build fails, open the app's Logs in Streamlit Cloud-errors usually point to a missing dependency.

The `echo: false` option disables the printing of code (only output is displayed).
